

Support traditional seed breeding programmes

elite varieties). Partial tolerance to Beet Mild Yellowing Virus (BMV) & Beet Yellowing Virus (BYV).

Additional varieties with partial (BMV) & Beet Yellowing Virus (BYV) tolerance, but with continued yield drag relative to the susceptible alternatives.

Continued development and introduction of partially tolerant/resistant varieties with less yield drag compared to elite varieties onto the industry Recommended List.

Gene Editing

Improved knowledge exchange to optimise mature plant resistance by advancing crop development to later stage. Communicating best practice on soil health, cultivation and till operations.

Improved pellet coatings to aid germination and faster crop establishment. Assessment of soil and foliar nutrient/microbiological applications to advance early leaf development. Development
